                                                                                                                                                                                                                                                                                                                        FUNCTION: SHOWS ACTIVITY ON LICHENAN, BETA-GLUCAN AND LAMINARIN BUT NOT ON CMC CELLULOSE OR XYLAN.

CAPALITIC ACTIVITY: Hydrolysis of 1,4-beta-D-glycosidic linkages in beta-D-glucans containing 1,3- and 1,4-bonds.

MISCELLANEOUS: The enzyme has a temperature optimum of 85 degrees Celsius and a pH optimum of 7.0.

SIMILARITY: BELONGS TO FAMILY 16 OF GLYCOSYL HYDROLASES.

-!- SIMILARITY: BELONGS TO FAMILY 33 OF GLYCOSYL HYDROLASES
-!- SIMILARITY: CONTAINS 4 BNR repeats.
                                                                                                                                                                                                                                                                                            Complete proteome
                                                                                                                                                                                                                                                                                                                                                                                                                                                            MICROBIAL INFECTIONS. NANH FACILITATES CHOLERA TOXIN BINDING TO HOST INTESTINAL EPITHELIAL CELLS BY CONVERTING CELL SURFACE POLYSIALOGANGLIOSIDES TO GMI MONGGANGLIOSIDES. CATALYTIC ACTIVITY: Hydrolysis of alpha-(2->3)-, alpha-(2->6)-, alpha-(2->8)-glycosidic linkages of terminal static residues in oliopsaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates. copactor: CALCIUM.

SUBCULTULAR LOCATION: Secreted.
INDUCTION: MAY BE CONTROLLED BY SIALIC ACID AVAILABILITY AND A GEOGRAPH - DHASE - NEPROMENTEM METGRANTEM

"Two beta-glycanase genes are clustered in Bacillus polymyxa:
molecular cloning, expression, and sequence analysis of genes
encoding a xylanase and an endo-beta-(1,3)-(1,4)-glucanase.";
J. Bacteriol. 173:7705-7710(1991).

-1. CATALYTIC ACTYVITY: Hydrolysis of 1,4-beta-D-glycosidic linkages
in beta-D-glucans containing 1,3 and 1,4-bonds.

-1. MISCELLANEOUS: BETA-GLUCANASES OF BACILLUS HAVE A SUBSTRATE RANGE
SIMILAR TO LICHENASE OF GERMINATING BARLEY.

-1. SIMILARITY: BELONGS TO FAMILY 16 OF GLYCOSYL HYDROLASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-NOV-1995 (Rel. 32, Created)

"The beta-glucanase gene from Bacillus amyLoliquefaciens shows
extensive homology with that of Bacillus subtills.";
Gene 49:177-187(1986).
-I- CATALYTIC ACTIVITY: Hydrolysis of 1,4 beta-D-glycosidic linkages
-I- MISCELLANEOUS: BETA-GLUCANASES OF BACILLUS HAVE A SUBSTRATE RANGI
SIMILARITY: BELONGS TO FAMILY 16 OF GLYCOSYL HYDROLASES.
                                                                                                                                                                                                                                                                                                           Hydrolase;
